

## Adv DevOps Exp 10

**Aim:** To perform Port, Service monitoring, Windows/Linux server monitoring using Nagios.

### Monitoring Using Nagios:

**Step 1:** To Confirm Nagios is running on the server side Perform the following command on your Amazon Linux Machine (Nagios-host).

Run this command **sudo systemctl status**

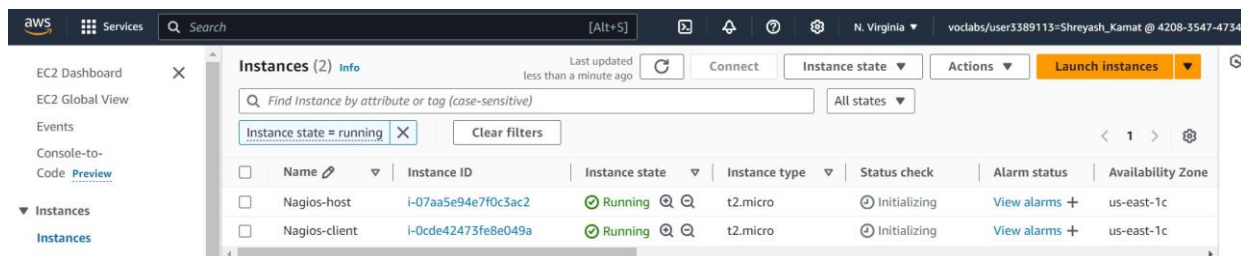

```
ec2-user@ip-172-31-41-160:~/downloads/nagios-plugins-2.4.11
[ec2-user@ip-172-31-41-160 nagios-plugins-2.4.11]$ sudo systemctl status
ip-172-31-41-160.ec2.internal
State: running
Units: 296 loaded (incl. loaded aliases)
Jobs: 0 queued
Failed: 0 units
Since: Wed 2024-10-02 12:28:05 UTC; 33min ago
systemd: 252.23-2.amzn2023
CGroup: /
├─init.scope
│   └─1 /usr/lib/systemd/systemd --switched-root --system --deserialize=32
├─system.slice
│   ├──acpid.service
│   │   ├──1938 /usr/bin/systemd-inhibit --what=handle-suspend-key:handle-hibernate-key --who=noah "--why=acpid instead" --mode=block /usr/sbin/acpid -f

│   └─libstoragemgmt.service
│       └─1940 /usr/bin/lsm -d
```

**Step 2:** Before we begin,

To monitor a Linux machine, create an **Ubuntu 20.04 server** EC2 Instance in AWS.

Provide it with the **same security group** as the Nagios Host and name it 'nagios-client' alongside the host.

The screenshot shows the AWS Management Console interface for an EC2 instance. The 'Network settings' tab is selected, and the 'Firewall (security groups)' section is expanded. It shows a list of security groups, including 'newsecurity sg-05d7468fe3a2f7a8e'. The 'Create security group' button is selected, and the 'Select existing security group' button is also visible. The 'Common security groups' section is also visible, showing a dropdown menu for selecting security groups.

### Step 3: TO BE DONE IN THE Nagios-host TERMINAL

In the nagios-host terminal, run this command

**ps -ef | grep nagios**

```
[ec2-user@ip-172-31-41-160 nagios-plugins-2.4.11]$ ps -ef | grep nagios
ec2-user  63115    2315    0 13:03 pts/0    00:00:00 grep --color=auto nagios
[ec2-user@ip-172-31-41-160 nagios-plugins-2.4.11]$
```

To become a root user, run 'sudo su' and make two directories using the following commands. If one is running these commands in windows powershell, make sure that he/she copies it line by line as powershell might make an error while interpreting multiple lines

**mkdir /usr/local/nagios/etc/objects/monitorhosts**

**mkdir /usr/local/nagios/etc/objects/monitorhosts/linuxhosts**

```
[ec2-user@ip-172-31-92-249 ~]$ sudo su
[root@ip-172-31-92-249 ec2-user]# mkdir /usr/local/nagios/etc/objects/monitorhosts
[root@ip-172-31-92-249 ec2-user]# mkdir /usr/local/nagios/etc/objects/monitorhosts/linuxhosts
[root@ip-172-31-92-249 ec2-user]#
```

Copy the sample localhost.cfg file to linuxhost folder. Use the following mentioned command to achieve it

**cp /usr/local/nagios/etc/objects/localhost.cfg**

**/usr/local/nagios/etc/objects/monitorhosts/linuxhosts/linuxserver.cfg**

Open linuxserver.cfg using nano and make the following changes. This is a conf type file in which we will have to modify the configurations in way which will help us specify the hosts and clients to be monitored

**nano /usr/local/nagios/etc/objects/monitorhosts/linuxhosts/linuxserver.cfg**

#### Changes to be made:

1. Change the hostname to linux-server (EVERYWHERE ON THE FILE)
2. Change address to the public IP address of your LINUX CLIENT.

### 3. Change hostgroup\_name under hostgroup to linux-servers1

```
# HOST DEFINITION
#
#####

# Define a host for the local machine

define host {

    use                linux-server          ; Name of host template to use
                                           ; This host definition will inherit all variables that are defined
                                           ; in (or inherited by) the linux-server host template definition.

    host_name          linux-server
    alias              localhost
    address            54.172.92.226
}

#####

# Define an optional hostgroup for Linux machines

define hostgroup {

    hostgroup_name     linux-servers1       ; The name of the hostgroup
    alias              Linux Servers        ; Long name of the group
    members            localhost           ; Comma separated list of hosts that belong to this group
}

#####
```

**IMP:** Everywhere else on the file, change the hostname to linux-server instead of localhost.

Open the Nagios Config file and add the following line

**nano /usr/local/nagios/etc/nagios.cfg**

Add the following line in the file and save

**cfg\_dir=/usr/local/nagios/etc/objects/monitorhosts/**

```
# OBJECT CONFIGURATION FILE(S)
# These are the object configuration files in which you define hosts,
# host groups, contacts, contact groups, services, etc.
# You can split your object definitions across several config files
# if you wish (as shown below), or keep them all in a single config file.

# You can specify individual object config files as shown below:
cfg_file=/usr/local/nagios/etc/objects/commands.cfg
cfg_file=/usr/local/nagios/etc/objects/contacts.cfg
cfg_file=/usr/local/nagios/etc/objects/timeperiods.cfg
cfg_file=/usr/local/nagios/etc/objects/templates.cfg

# Definitions for monitoring the local (Linux) host
cfg_file=/usr/local/nagios/etc/objects/localhost.cfg
cfg_dir=/usr/local/nagios/etc/objects/monitorhosts/
# Definitions for monitoring a Windows machine
#cfg_file=/usr/local/nagios/etc/objects/windows.cfg
```

Verify the configuration files by running the following command

**/usr/local/nagios/bin/nagios -v /usr/local/nagios/etc/nagios.cfg**

```
[root@ip-172-31-41-160 nagios-plugins-2.4.11]# /usr/local/nagios/bin/nagios -v /usr/local/nagios/etc/nagios.cfg

Total Warnings: 0
Total Errors: 0

Things look okay - No serious problems were detected during the pre-flight check
[root@ip-172-31-41-160 nagios-plugins-2.4.11]#
```

You are good to go if there are no errors.

Restart the nagios service

**service nagios restart**

And by running `sudo systemctl status nagios`, we can again check whether our server is running or not

```
[root@ip-172-31-41-160:/tmp/nagios-plugins-2.4.11]
[root@ip-172-31-41-160 nagios-plugins-2.4.11]# sudo systemctl restart nagios
[root@ip-172-31-41-160 nagios-plugins-2.4.11]# sudo systemctl status nagios

```

[illegible]

Open nrpe.cfg file to make changes.

```
sudo nano /etc/nagios/nrpe.cfg
```

Under `allowed_hosts`, add your nagios host IP address like so

```

ubuntu@ip-172-31-36-100: ~
GNU nano 7.2
#
# Note: The daemon only does rudimentary checking of the client's IP
# address. I would highly recommend adding entries in your /etc/hosts.allow
# file to allow only the specified host to connect to the port
# you are running this daemon on.
#
# NOTE: This option is ignored if NRPE is running under either inetd or xinetd
allowed_hosts=127.0.0.1,34.229.45.75
#
# COMMAND ARGUMENT PROCESSING
# This option determines whether or not the NRPE daemon will allow clients
# to specify arguments to commands that are executed. This option only works
# if the daemon was configured with the --enable-command-args configure script

```

Now restart the NRPE server by this command.

**sudo systemctl restart nagios-nrpe-server**

```

ubuntu@ip-172-31-36-100:~$ sudo systemctl restart nagios-nrpe-server
ubuntu@ip-172-31-36-100:~$

```

Run the following command in the Nagios-host terminal

**sudo systemctl status nagios**

```

[root@ip-172-31-41-160 nagios-plugins-2.4.11]# sudo systemctl status nagios

Page Tour

Click on linux-server to view host information

The screenshot displays the Nagios web interface for the host 'localhost (linux-server)'. The interface includes a sidebar with navigation links such as Home, Documentation, Current Status, Tactical Overview, Map, Hosts, Services, Host Groups, Service Groups, Problems, Reports, and System. The main content area is divided into several sections:

- Host Information:** Shows the host's last update time (Wed Oct 2 13:40:56 UTC 2024), update frequency (every 90 seconds), and the user logged in (nagiosadmin).
- Host State Information:** Displays the host's current status as 'UP' (for 0d 0h 20m 39s). It also shows performance data (PING OK - Packet loss = 0%, RTA = 0.84 ms), current attempt (1/10 - HARD state), last check time (10-02-2024 13:40:17), check type (ACTIVE), check latency/duration (0.000 / 4.121 seconds), next scheduled active check (10-02-2024 13:45:17), last state change (10-02-2024 13:20:17), last notification (N/A), and whether the host is flapping (NO) or in scheduled downtime (NO).
- Host Commands:** A list of commands that can be executed on the host, such as 'Locate host on map', 'Disable active checks of this host', 'Re-schedule the next check of this host', etc.
- Host Comments:** A section for adding or deleting comments about the host.

The bottom of the interface shows a Windows taskbar with the date and time (19:11, 02-10-2024) and system status (31°C, Haze).

We can even navigate to the services section, which explicitly mentions the status, duration, checks, information about the numerous services present on our hosts

The screenshot displays the Nagios web interface for the 'Service Status Details For All Hosts'. The interface includes a sidebar with navigation links such as Home, Documentation, Current Status, Tactical Overview, Map, Hosts, Services, Host Groups, Service Groups, Problems, Reports, and System. The main content area is divided into several sections:

- Current Network Status:** Shows the current network status (Last Updated: Wed Oct 2 13:42:09 UTC 2024, Updated every 90 seconds, Nagios Core 4.5.5, www.nagios.org, Logged in as nagiosadmin).
- Host Status Totals:** A summary table showing the status of all hosts (Up, Down, Unreachable, Pending).
- Service Status Totals:** A summary table showing the status of all services (Ok, Warning, Unknown, Critical, Pending).
- Service Status Details For All Hosts:** A detailed table showing the status of all services on all hosts. The table includes columns for Host, Service, Status, Last Check, Duration, Attempt, and Status Information.

The bottom of the interface shows a Windows taskbar with the date and time (19:11, 02-10-2024) and system status (31°C, Haze).

**Conclusion:** In conclusion, the experiment focused on monitoring ports, services, and a Linux server using Nagios. Through the step-by-step process, we successfully configured Nagios to monitor essential network services on the Linux server. By setting up both the Nagios host and client, we were able to track system performance, ensure service availability, and monitor key metrics like CPU and memory usage.
